1 Python Data Structure: Dictionaries & Tuples

Ahmed Moustafa

2 Dictionaries

- A dictionary is an unordered collection of key-value pairs.
- Each key is unique and maps to a value.
- The syntax for creating a dictionary is:

```
[13]: my_dict = {"key1": "value1", "key2": "value2", "key3": "value3"}  
my_dict
```

```
[13]: {'key1': 'value1', 'key2': 'value2', 'key3': 'value3'}
```

3 Example - States

```
[14]: d = {}                                # Create empty dict  
d['ca'] = 'California' # 1. Set key/value pairs into dict  
d['ok'] = 'Oklahoma'  
d['nj'] = 'New Jersey'  
d['tx'] = 'Texas'  
d
```

```
[14]: {'ca': 'California', 'ok': 'Oklahoma', 'nj': 'New Jersey', 'tx': 'Texas'}
```

```
[15]: from IPython.display import display, Image
display(Image(url="https://cs.stanford.edu/people/nick/py/img/python-dict2.
↳png", width = 300))
```

<IPython.core.display.Image object>

You can access values in a dictionary using their keys:

```
[16]: print(my_dict["key1"]) # Output: "value1"
```

value1

4 Commonly used functions

- `keys()`: Returns a list of all the keys in the dictionary
- `values()`: Returns a list of all the values in the dictionary
- `items()`: Returns a list of all the key-value pairs in the dictionary

```
[17]: phonebook = {"Alice": "555-1234", "Bob": "555-5678", "Charlie": "555-9012"}
phonebook
```

```
[17]: {'Alice': '555-1234', 'Bob': '555-5678', 'Charlie': '555-9012'}
```

```
[18]: print(phonebook["Alice"])
```

555-1234

```
[19]: print(phonebook.keys())
```

dict_keys(['Alice', 'Bob', 'Charlie'])

```
[20]: print(phonebook.values())
```

dict_values(['555-1234', '555-5678', '555-9012'])

```
[21]: print(phonebook.items())
```

dict_items([('Alice', '555-1234'), ('Bob', '555-5678'), ('Charlie', '555-9012')])

```
[22]: phonebook["John"]
```

KeyError

Traceback (most recent call last)

Cell In[22], line 1

----> 1 phonebook["John"]

```
KeyError: 'John'
```

5 Tuples

- A tuple is an ordered collection of values.
- Tuples are immutable, meaning you can't modify their values once they're created.
- The syntax for creating a tuple is:

```
[23]: my_tuple = ("value1", "value2", "value3")
      my_tuple
```

```
[23]: ('value1', 'value2', 'value3')
```

You can access values in a tuple using their index:

```
[24]: print(my_tuple[0])
```

```
value1
```

6 Commonly used functions:

- `count()`: Returns the number of times a value appears in the tuple
- `index()`: Returns the index of the first occurrence of a value in the tuple Example:

```
[25]: days_of_week = ("Monday", "Tuesday", "Wednesday", "Thursday", "Friday",
    ↪ "Saturday", "Sunday")
      days_of_week
```

```
[25]: ('Monday', 'Tuesday', 'Wednesday', 'Thursday', 'Friday', 'Saturday', 'Sunday')
```

```
[26]: print(days_of_week[0])
```

```
Monday
```

```
[27]: print(days_of_week.count("Monday"))
```

```
1
```

```
[28]: print(days_of_week.index("Wednesday"))
```

```
2
```

7 Differences between Dictionaries and Tuples

- Dictionaries and tuples are used for different purposes.
- Dictionaries are used to map unique keys to values, while tuples are used to store collections of values.
- Dictionaries are mutable, while tuples are immutable.
- Dictionaries are unordered, while tuples are ordered.

8 More Example

Storing information about a person, such as their name, address, and phone number:

```
[29]: person = {"name": "Jane Doe", "address": "123 Main St", "phone": "555-1234"}
      person
```

```
[29]: {'name': 'Jane Doe', 'address': '123 Main St', 'phone': '555-1234'}
```

Storing a dictionary of translations between different languages:

```
[30]: translations = {"hello": {"spanish": "hola", "french": "bonjour"}}
      translations
```

```
[30]: {'hello': {'spanish': 'hola', 'french': 'bonjour'}}
```

Representing a point in two-dimensional space:

```
[31]: point = (3, 5)
      point
```

```
[31]: (3, 5)
```

Storing the RGB color values for a particular color:

```
[32]: color = (255, 128, 0)
```
