Lists

February 13, 2023

1 Introduction to Python

1.1 Lists & Dictionaries & Tuples

- Slides by Ahmed Moustafa
- Content modified from Pierian Data

2 Lists

- Lists can be thought of the most general version of a sequence in Python.
- Unlike strings, they are **mutable**, i.e. elements inside a list can be changed.
- Lists are constructed with brackets [] and commas, separating every element in the list.

3 Creating a List

- [2]: weights = [65.0, 70.5, 72.3, 68.0, 77.2] # list of numbers weights
- [2]: [65.0, 70.5, 72.3, 68.0, 77.2]
- [3]: cities = ["London", "Paris", "New York", "Tokyo", "Berlin"] # list of strings cities
- [3]: ['London', 'Paris', 'New York', 'Tokyo', 'Berlin']
- [4]: types = [1, 2.5, "hello", "world", 42, "python"] # list of different data types types
- [4]: [1, 2.5, 'hello', 'world', 42, 'python']

4 List of Lists

Here is an example of creating list of lists:

```
[5]: my_list = [cities, weights]
my_list

[5]: [['London', 'Paris', 'New York', 'Tokyo', 'Berlin'],
       [65.0, 70.5, 72.3, 68.0, 77.2]]

[6]: len(my_list)
[6]: 2
```

5 Indexing and Slicing 1/3

Indexing and slicing work just like in strings:

```
[7]: 'London'
[8]: cities[1:]
[8]: ['Paris', 'New York', 'Tokyo', 'Berlin']
[9]: cities[::-1]
[9]: ['Berlin', 'Tokyo', 'New York', 'Paris', 'London']
[10]: cities + ["Cairo", "Alexandria"]
[10]: ['London', 'Paris', 'New York', 'Tokyo', 'Berlin', 'Cairo', 'Alexandria']
```

6 Indexing and Slicing 2/3

```
'Cairo',
       'Alexandria',
       'London',
       'Paris',
       'New York',
       'Tokyo',
       'Berlin',
       'Cairo',
       'Alexandria']
[14]: len(cities)
[14]: 7
[15]: # Indexing and Slicing 3/3
[16]: my_list
[16]: [['London', 'Paris', 'New York', 'Tokyo', 'Berlin', 'Cairo', 'Alexandria'],
       [65.0, 70.5, 72.3, 68.0, 77.2]]
[17]: len(my_list)
[17]: 2
[18]: my_list[0]
[18]: ['London', 'Paris', 'New York', 'Tokyo', 'Berlin', 'Cairo', 'Alexandria']
[19]: my_list[1][2]
[19]: 72.3
```
